50-word description

Safire is a polished Markdown knowledge forge for Windows, macOS, and Linux. Notes remain ordinary files in a folder the user controls, while Safire adds search, tags, wikilinks, backlinks, an interactive relationship graph, daily notes, tasks, attachments, web capture, templates, and recoverable edits.

100-word description

Safire is a privacy-focused Markdown workspace for people who want connected thinking without surrendering ownership of their files. Notes remain ordinary `.md` files in a local vault, while Safire adds a modern cross-platform desktop experience: split editing and preview, tabs, search, tags, wikilinks, backlinks, a force-directed relationship graph, daily notes, vault-wide tasks, templates, web capture, attachments, keyboard navigation, autosave, and backup preview and restore. Its application service binds to the local computer, and Safire does not include telemetry or a hosted sync service. Users choose their own backup or synchronization tools for the vault.

What Makes Safire Different

Beautiful but portable

Safire gives local Markdown files a polished desktop interface without locking notes into a proprietary database.

Connected projects

Named projects keep their entries separate, while project-only graphs use wikilinks, backlinks, folder clusters, filtering, grouping, and hover highlighting to reveal internal relationships.

Trust-centered workflow

Autosave, backend backup-before-write, delete backups, backup preview, and restore reduce the fear of losing work.

Files you control

Safire is built around a user-selected local vault and a loopback-only service, with no hosted sync or telemetry.

Safire is a knowledge forge: fast enough for daily capture, connected enough for deep projects, and local enough to stay yours.
